Glossary

Annualised volatility: risk is measured by the variability of performance. The higher the standard deviation, the greater the variability (and therefore the risk) of the Fund or the index.

Maximum historic loss: is the maximum loss from peak to trough in an investment's history. The figures are indicative and will depend on circumstance.

Sharpe ratio: measures the risk/return trade-off. It is the annualised return less the average risk-free rate, divided by the annualised volatility of the model.

This document is intended to aid a wider discussion between clients and their investment and/or financial adviser about this investment portfolio. It is for information purposes only and is not to be construed as a solicitation or an offer to purchase or sell investments, address the financial situations or needs of any specific investor nor is it deemed to be a form of advice to invest in this portfolio. Investors should make their own investment decisions based upon their own financial objectives and financial resources and, if in any doubt, should seek advice from an investment and/or financial adviser.

Investment objective

Our objective for this strategy is to achieve a return of inflation +3% over a minimum rolling period of seven years. A proportion of the overall return will come from the income generated. The strategy is designed to generate risk adjusted returns over the suggested time horizon. The portfolio will be a balanced mix of fixed income assets, global equity investments and other diversifying financial instruments. To assist in the reduction of volatility and deliver uncorrelated returns during periods of unfavourable market conditions, alternative asset classes such as commodities, currencies, infrastructure and hedge funds may be used. Investors in the Risk Profile 4 strategy are prepared to accept occasional moderate capital losses in order to achieve slightly higher total returns.

Performance since inception (01/01/2010)

Discrete performance (%)

Total return to end of last calendar quarter 31/12/2023.

Portfolio Manager commentary

2023 ended with a bang, and November and December proved to be richly rewarding months for investors. Global equities rose by 10% in the last two months of 2023, with global bonds also rising an impressive 7%.

The change in tone from the miserable month of October 2023 was down to a major shift in messaging from the US Federal Reserve in terms of interest rates, and the US Treasury over bond issuance. The consensus is now expecting significant policy loosening (interest rate cuts) in 2024 and, while there has been a modicum of pushback in recent weeks, the US Federal Reserve has not tried overly hard to change investors' minds. At the same time as this change of mentality around interest rates and a symbiotic shift lower in bond yields, recent economic data has been dull but not disastrous, hinting that an economic 'soft landing' is still the 'base case'.

The obvious question is whether there will now be a period of 'January blues' for investors, as markets digest the significant gains made over the past couple of months. Markets have moved a long way very quickly and there is little doubt that expectations around the supportive backdrop for markets (economic growth, receding inflation and rate cuts) will be tested at various points in the coming months. We suspect that the downward move in bond yields has been overly aggressive in recent weeks, not least given how much fresh debt will need to be issued later this year, and some indigestion is likely. We view current government bond yields and credit spreads (excess yield gap over government bonds) as towards to the bottom of likely short-term range.

Despite short term risks and likely volatility, we still believe that the compensation offered in fixed interest markets is appropriate and we should make money from bonds this year. Equity valuations are now more expensive, and they will be tested by corporate results in 2024 and corporate managements' guidance for the uncertain year ahead. Our base case for equity markets remains that there are plenty of opportunities in various sectors and regions where valuations are appropriate, and we again expect to make positive returns this year.

Technically, equity markets look in decent shape, with the US market in particular now benefitting from a broadening out of positive moves, after a period in the first 10 months of 2023 when the "Magnificent Seven" dominated returns. The biggest risk arguably comes from investor complacency in a year where economic uncertainty will be high and political risks are elevated.

2023 was a year for 'balance, diversification, and an open-minded approach to investment'. It might well be repetitive to say the same now, but 2024 seems likely to be a year when those mottos are once again very relevant.
